

Data Contextualization

Problem

Traditionally a Data Historian is used to collect alarm and event data. The emergence of multiple data protocols can make the centralization of required data difficult and complex. Customers are utilizing analytical applications such as PowerBI and Seeq as their interface to establish the relationships of trends and events as they occur and the impacts on their manufacturing outputs.

Solution

Utilization of a Data Hub platform provides more integration options than a traditional data historian, and existing data can be migrated to maintain continuity. The Data Hub provides connectivity, redundancy, and 3rd party server interface capabilities.

noesis

A proven process management solutions partner, providing data insights and connectivity across any level of an organization to maximize business decision making.
