

Product Specific Data Management

Problem

Maintaining product specific recipe configurations is costly, time consuming and introduces opportunity for process shift between product configurations and new product introductions. This leads to a higher burden of ownership and the potential for events that impact product quality.

Solution

Product specific data should be developed and housed in a process knowledge management platform (PKM). A PKM utilizes product-specific parameters and sequence of operations. Sequence of function can be maintained in product-agnostic execution recipes that access parameters, via the MES.

noesis

A proven process management solutions partner, providing data insights and connectivity across any level of an organization to maximize business decision making.
