

# Batch Production Record Generation

## Problem

Batch record data is compiled from many sources, making exception detection, review and resolution prone to errors. The time needed to confirm GMP requirements are being met can be costly. Furthermore, product demand requires nearly real-time batch record review and release.

## Solution

To minimize replication of data, using a database reporting tool capable of querying multiple sources to support a single context-driven report is recommended for batch record report generation.

**noesis**

A proven process management solutions partner, providing data insights and connectivity across any level of an organization to maximize business decision making.
